 $J(\theta_0,\theta_1)$ 

(function of the parameters  $heta_0, heta_1$ )

(for fixed  $\theta_0$ ,  $\theta_1$ , this is a function of x)

 $J(\theta_0, \theta_1)$ 

(function of the parameters  $heta_0, heta_1$ )

(for fixed  $\theta_0$ ,  $\theta_1$ , this is a function of x)

 $J(\theta_0, \theta_1)$ 

(function of the parameters  $heta_0, heta_1$ )

Machine Learning

## Linear regression with one variable

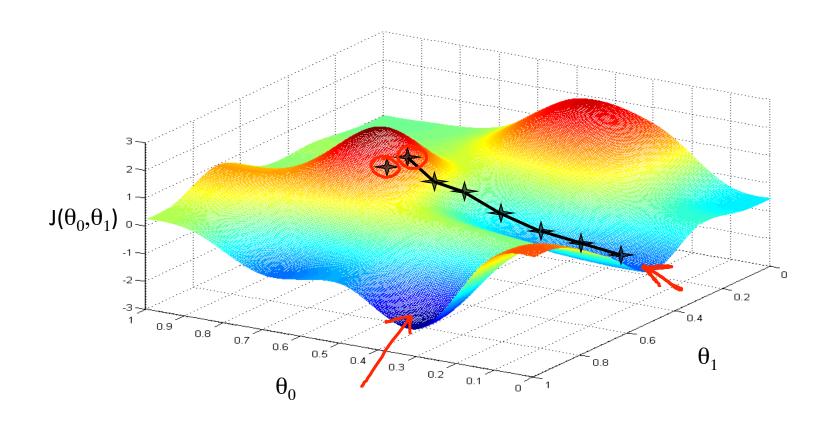

# Gradient descent

Have some function 
$$J(\theta_0,\theta_1)$$
  $J(\theta_0,\theta_1)$   $J(\theta_0,\theta_1)$ 

#### **Outline:**

- Start with some  $\theta_0, \theta_1$  ( Say  $\Theta_0 = 0, \Theta_1 = 0$ )
- Keep changing  $\underline{\theta_0},\underline{\theta_1}$  to reduce  $\underline{J(\theta_0,\theta_1)}$  until we hopefully end up at a minimum

### **Gradient descent algorithm**

$$\frac{\mathbf{Q}_{i} = \mathbf{q} + \mathbf{1}}{\mathbf{q} + \mathbf{1}} = 0$$

Assignment

$$\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_i} J(\theta_0, \theta_1)$$

(for 
$$j = 0$$
 and  $j = 1$ )

Simultaneously update

So and S

tearning rate

- $temp0 := \theta_0 \alpha \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$  $\rightarrow$  temp1 :=  $\theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$
- $\rightarrow \theta_0 := \text{temp}0$
- $\rightarrow \theta_1 := \text{temp1}$

### Incorrect:

$$:= \theta_0 - \alpha \frac{\partial}{\partial \theta} J(\theta_0, \theta_1)$$

$$\Rightarrow \underline{\text{temp0}} := \theta_0 - \alpha \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$$

$$\rightarrow \theta_0 := \text{temp0}$$

 $temp1 := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$ 

$$\rightarrow \overline{\theta_1} := \text{temp1}$$

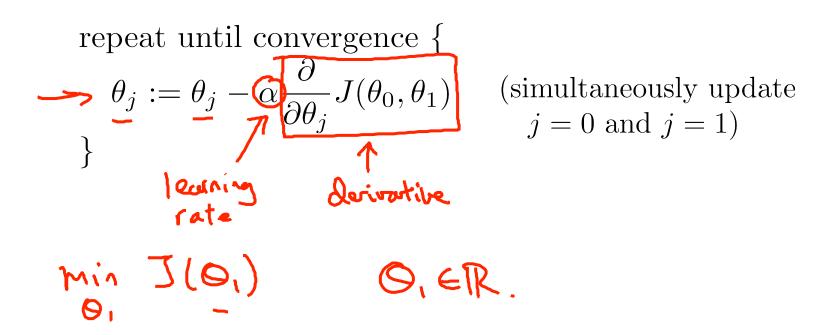

Machine Learning

# Linear regression with one variable

Gradient descent intuition

### **Gradient descent algorithm**

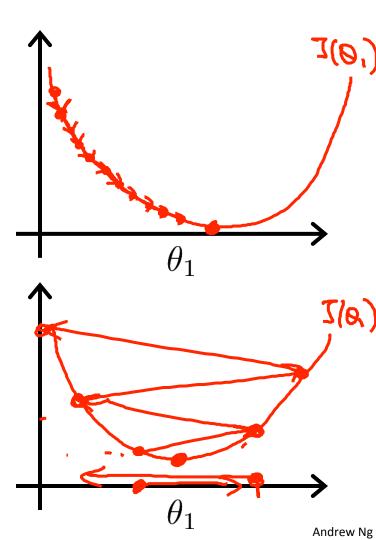

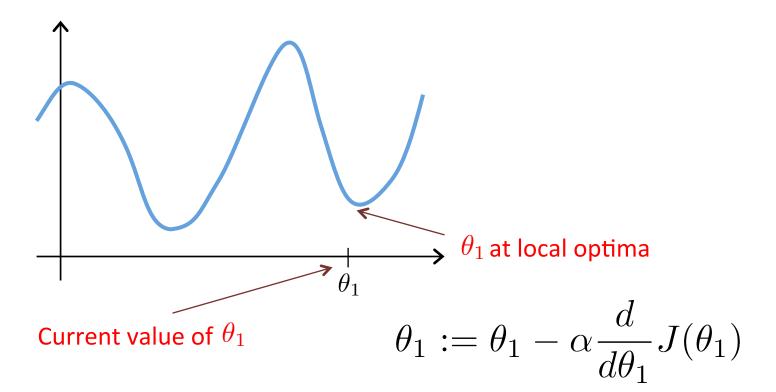

Andrew Ng

$$\theta_1 := \theta_1 - \bigcirc \frac{\partial}{\partial \theta_1} J(\theta_1)$$

If  $\alpha$  is too small, gradient descent can be slow.

If  $\alpha$  is too large, gradient descent can overshoot the minimum. It may fail to converge, or even diverge.

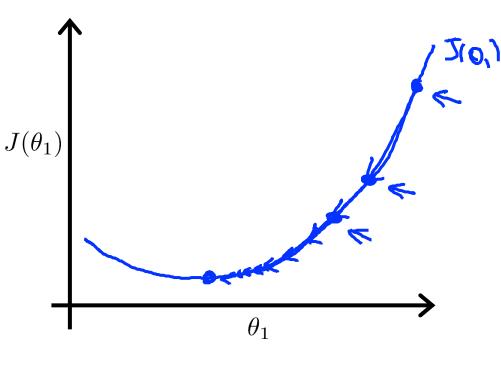

Gradient descent can converge to a local minimum, even with the learning rate  $\alpha$  fixed.

$$\theta_1 := \theta_1 - \alpha \frac{d}{d\theta_1} J(\theta_1)$$

As we approach a local minimum, gradient descent will automatically take smaller steps. So, no need to decrease  $\alpha$  over time.

Machine Learning

# Linear regression with one variable

Gradient descent for linear regression

#### Gradient descent algorithm

repeat until convergence {  $\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1)$ 

(for 
$$j = 1$$
 and  $j = 0$ )

#### **Linear Regression Model**

$$h_{\theta}(x) = \theta_0 + \theta_1 x$$

$$J(\theta_0, \theta_1) = \frac{1}{2m} \sum_{i=1}^{m} \left( h_{\theta}(x^{(i)}) - y^{(i)} \right)^2$$

$$\frac{\partial}{\partial \theta_{j}} J(\theta_{0}, \theta_{1}) = \frac{2}{30j} \underbrace{\frac{1}{2m} \underbrace{\frac{2}{2m} (h_{0}(x^{(i)}) - y^{(i)})^{2}}_{\text{in}}}_{\text{in}} \underbrace{\frac{2}{2m} (h_{0}(x^{(i)}) - y^{(i)})^{2}}_{\text{in}}$$

$$= \frac{2}{30j} \underbrace{\frac{2}{2m} \underbrace{\frac{2}{2m} (h_{0}(x^{(i)}) - y^{(i)})^{2}}_{\text{in}}}_{\text{in}} \underbrace{\frac{2}{2m} (h_{0}(x^{(i)}) - y^{(i)})^{2}}_{\text{in}}$$

$$j = 0: \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1) = \frac{1}{m} \stackrel{\text{Plank}}{=} \left( h_{\bullet} \left( \chi^{(i)} \right) - y^{(i)} \right)$$
 $j = 1: \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1) = \frac{1}{m} \stackrel{\text{Plank}}{=} \left( h_{\bullet} \left( \chi^{(i)} \right) - y^{(i)} \right). \quad \chi^{(i)}$ 

**Gradient descent algorithm** 

repeat until convergence {

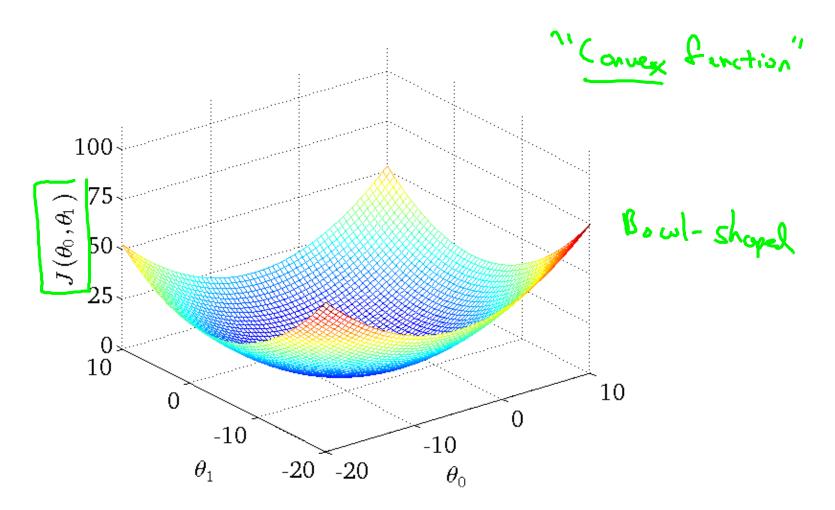

$$\theta_0 := \theta_0 - \alpha \frac{1}{m} \sum_{i=1}^m \left( h_{\theta}(x^{(i)}) - y^{(i)} \right)$$

$$\theta_1 := \theta_1 - \alpha \frac{1}{m} \sum_{i=1}^m \left( h_{\theta}(x^{(i)}) - y^{(i)} \right) \cdot x^{(i)}$$

update  $\theta_0$  and  $\theta_1$  simultaneously

 $J(\theta_0,\theta_1)$ 

 $J(\theta_0, \theta_1)$ 

 $J(\theta_0, \theta_1)$ 

 $J(\theta_0, \theta_1)$ 

 $J(\theta_0, \theta_1)$ 

 $J(\theta_0, \theta_1)$ 

 $J(\theta_0, \theta_1)$ 

 $J(\theta_0, \theta_1)$ 

## "Batch" Gradient Descent

"Batch": Each step of gradient descent uses all the training examples.
